Lecture 6: Trees

Heading: Trees
A tree is a hierarchical data structure composed of nodes connected by directed edges. A tree has exactly one root node with no incoming edges, and every non-root node has exactly one parent. Nodes with no children are called leaf nodes. Trees are acyclic connected structures commonly used for representing hierarchical hierarchies.

Lecture 6: Binary Trees

Heading: Binary Trees
A binary tree is a tree data structure where each node has at most two child nodes, traditionally distinguished as the left child and right child. Tree traversals (inorder, preorder, postorder) are naturally defined recursively over the subtrees.
