Lecture 7: Binary Search Trees

Heading: Binary Search Trees
A Binary Search Tree (BST) is a binary tree in which each node satisfies the BST ordering property: all keys stored in the left subtree are strictly less than the node key, and all keys stored in the right subtree are strictly greater than the node key. This ordering property allows binary search operations with expected O(log n) time complexity.

Lecture 7: BST Operations

Heading: BST Insertion and Search
Inserting into a Binary Search Tree (BST) compares the incoming value against the current node and recursively traverses to the left or right subtree until an empty spot is reached. However, unbalanced insertions can degrade performance to O(n).
